

An Introduction to GitHub for Librarians and Archivists

12/13/2017

Dinah Handel, NYPL and
Ethan Gates, NYU-MIAP

What is GitHub?

- Software development platform
- Hosting for code/applications
- “Social network”
- Both personal and enterprise service
- Web-based, graphical interface for git

Git and Version Control

- Command-line software developed by Linus Torvalds in 2005 for development of the Linux kernel
- Tracks and saves all changes to a given directory
- Snapshot-based
- Can be used locally or over a network
- Supports non-linear development

git

So what's the problem??

Repositories

- “Repo”
- The folder/directory that contains your project
- Can be hosted locally or remotely

ProTip! Looking for most starred repositories? [Try this search](#)

gurugio / lowlevelprogramming-university ★ Star

How to be low-level programmer

★ 2,263 🍷 104 Built by 

★ 1,767 stars today

freeCodeCamp / freeCodeCamp ★ Star

The <https://freeCodeCamp.com> open source codebase and curriculum. Learn to code and help nonprofits.

🟡 JavaScript ★ 257,527 🍷 10,916 Built by 

★ 602 stars today

prettier / prettier ★ Star

Prettier is an opinionated JavaScript formatter.

🟡 JavaScript ★ 7,550 🍷 245 Built by 

★ 561 stars today

tootsuite / mastodon ★ Star

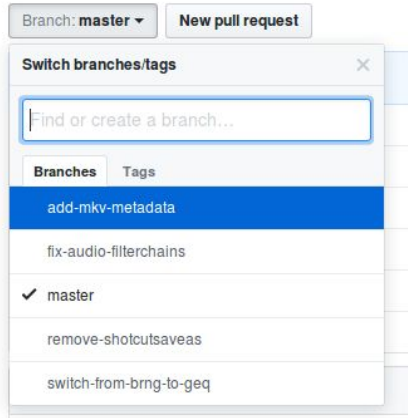

A GNU Social-compatible microblogging server

🟠 Ruby ★ 6,309 🍷 897 Built by 

★ 499 stars today

Branches

- Individual versions of the repository - within the repository
- “Master” branch: front-facing, most stable (the version of a project or app others will likely download/use/edit)
- All editing or changes to codebase usually occur in branches

Commit

- Updating the codebase with the changes you've made, either to the master branch or via a pull request from another branch or a forked repository

Commit changes

added example sentence

Add an optional extended description...

Commit directly to the `master` branch.

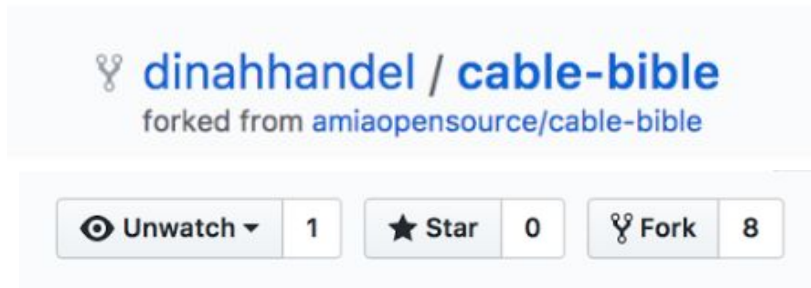

Create a **new branch** for this commit and start a pull request. [Learn more about pull requests.](#)

Commit changes

Cancel

Forking

- A copy of a repository
- When you “fork” a repo, you are able to make changes to the code without it affecting the codebase
- Forks are useful for proposing changes to someone else’s code, or build your own project using someone else’s code as the starting point.

Pull Request

- Form of communication and notification on GitHub when working in branches or forks
- Tells others about changes you've proposed to the code
- Method of integrating changes to the code
- You create the pull request and someone else merges your pull request into the code, assuming there are no conflicts
- Mostly useful when editing code using the GitHub Desktop application

Markdown

- A plain text formatting syntax
- A software tool that converts plain text formatting to HTML
- Used on GitHub to structure text-based files - documentation, README's, are some examples
- Relatively straightforward and simple once you remember the important symbols and rules

```
1 # Markdown Preview
2
3 Type on the __left__, see it
4 * __rendered__ on the __right__.
5
6 This is a
7 * [link](https://github.com).
8
9 - and this is
10 - a list
11
12 :tada: :fireworks:
```

Markdown Preview

Type on the **left**, see it *rendered* on the **right**.

Test Repos

https://github.com/dinahhandel/METRO_testingrepo

<https://github.com/EG-tech/talking-tech>

GitHub Desktop

- Stand-alone “staging ground” application
- Syncs local repositories with your repositories hosted on GitHub
- Pushes commits and pull requests to GitHub without going through the web interface
- Gives you the flexibility to edit and manipulate files/code on GitHub without going through the web interface, but is not an editor itself
